# Context

## Oracle problem

Oracle hypothesis: it's possible to determine if an output is correct

→ FALSE

# Context

## Oracle problem

Oracle hypothesis: it's possible to determine if an output is correct

→ FALSE

In reality:

- ▶ no oracle;
- ▶ too difficult to implement.

# Context

## Oracle problem

Oracle hypothesis: it's possible to determine if an output is correct

➡ FALSE

In reality:

- ▶ no oracle;
- ▶ too difficult to implement.

**Machine learning models have an oracle problem!**

# Context

## Oracle problem

Metamorphic relations:

- ▶ No verification of each input / output;
- ▶ Verification of properties between input / output.

 **Ligthen the problem of the oracle!**

# Convex-based metamorphic relations

## Convex definition

### Definition

A part  $H$  of  $\mathbb{R}^n$  said to be convex if, for all pairs  $(x, y)$  of elements of  $H$ , the segment  $[x, y]$  is entirely contained within  $H$ . In other words,  $H$  is convex when  $\forall x, y \in H$  and  $\forall \lambda \in [0; 1], \lambda x + (1 - \lambda)y \in H$  [10].

(a) A convex

(b) A non-convex

# Convex-based metamorphic relations

How they are created?

- ▶ Using the algorithm **QuickHull**  $nD$  (*QHull*<sup>1</sup>).
- ▶ Approximation of influence areas of classes.

<sup>1</sup><http://www.qhull.org/>

# Convex-based metamorphic relations

## Membership relation — MR 6

Hypothesis:

- ▶ Convex = one area of class.
- ▶ Point inside → similar characteristics.  
→ identical class.

# Convex-based metamorphic relations

## Superposition relation — MR 7

Observations:

- ▶ Shared areas.
- ▶ Which choice will the models make? ➡ We don't choose!

# Convex-based metamorphic relations

## Attachment relation — MR 8

Hypothesis:

- ▶ Model extrapolation.
- ▶ Nearest convex(es) → similar characteristics.  
→ identical class.

# Convex-based metamorphic relations

## Limits & Robustness

Tests evaluate values:

- ▶ within the limits;
- ▶ at the limits;
- ▶ off limits.

# Convex-based metamorphic relations

## Limits & Robustness

Tests evaluate values:

- ▶ within the limits;
- ▶ at the limits;
- ▶ off limits.

→ in the domain;

→ borders of the domain;

→ outside the domain.

# Convex-based metamorphic relations

## Limits & Robustness

Tests evaluate values:

- ▶ within the limits; → in the domain;
- ▶ at the limits; → borders of the domain;
- ▶ off limits. → outside the domain.

Models must:

- Do not produce an error: **Robustness — MR 9**
- Do not produce an error when the value is outside the domain: **Boundary Robustness — MR 10**
- Respect the relation **Boundary Attachment — MR 11**

# Convex-based metamorphic relations

Illustration of the use of limits

**Values:**

► all at the limits;

# Convex-based metamorphic relations

Illustration of the use of limits

$p'_3$

Values:

- ▶ all at the limits;
- ▶ only one at the limits;
- ▶ one out of limits.

- 3 Convex-based metamorphic relations
- 4 Non-convex metamorphic relations**
- 5 Experimentations
- 6 Conclusion

# Non-convex metamorphic relations

Precision relation — MR 12

(a) Data set

(b) Expected predictions

# Non-convex metamorphic relations

Outliers relation — MR 13

Origin:

- ▶ added to the dataset;
- ▶ already existing.

# Non-convex metamorphic relations

Outliers relation — MR 13

Origin:

- ▶ added to the dataset;
- ▶ already existing.

**Models shouldn't predict them correctly!**

70 276 models

Analysis :

- ▶ 2 failures - **MR 1** ;
- ▶ robustness ✓ ;
- ▶ too many failures - **MR 5**.

# Table of contents

- 1 Context
- 2 State-of-the-art metamorphic relations
- 3 Convex-based metamorphic relations
- 4 Non-convex metamorphic relations
- 5 Experimentations
- 6 Conclusion

# Conclusion

- ▶ 5 state-of-the-art relations;
- ▶ 8 new metamorphic relations;
  - ▶ 6 based on convexes;
  - ▶ 2 not.
- ▶ evaluation of 21 algorithms with 70 276 models;
- ▶ revealed the probable existence of bugs.
